... control system for aircraft maintenance work area, has data processing and storing system that compares biometric data of individual with data stored in digital card, where individual is identified by comparison...

Inventor: HARPER J

Abstract (Basic):

... The system has a read write system for digitally reading from and writing to a digital card that stores biometric information. A data processing and storing system (14) obtains biometric data and compares with the data stored in the card. The data is displayed in a display system. The individual is identified by the comparison of biometric data, and the information pertaining to the comparison is encoded on the card.

...SPECIFICATION the digital recording medium.

In a particularly preferred embodiment the portable support device is a
smart card adapted to be received in a **smart card reader** in the
decoder and/or digital recorder. In this application the term "**smart
card**" is used to mean any conventional chip-based card device
possessing, for example, microprocessor or...

...shaped devices such as are often used in TV decoder systems.

In one embodiment, the **smart card** also contains the equivalent of
the first key used to decrypt the control word for...

...for viewing in the case of a television broadcast system. In such a
case, the **smart card** forms part of the pay TV system and may also
contain a personalised key known...

...end of the month.

In an alternative embodiment, the second key is stored on a **smart
card** different from that used to store the first key. In such an

embodiment, reading of...

...watch previously recorded films provided the digital recorder/player that he possesses is adapted to read the accompanying smart card.

In such a system, a single smart card and second key may be used to generate the re - encrypted code word for a plurality of recordings. In such a way, a single "library card" can be used to decrypt any number of recordings.

In the invention, the smart card also contains a number of credit units to determine how many times the recording may be replayed, the number of units being decremented with...

...is particularly applicable to the case where the second key algorithm is stored on a smart card associated with the recording medium. However, in an alternative embodiment, the portable support is defined...

...be copied from within the embedded chip. The variations described above with regard to the smart card embodiments are equally applicable to systems in which the support is defined by the recording...

...relation to a method but applies equally to a combination of a decoder and a smartcard ; and a smartcard .

The terms " scrambled " and " encrypted " and " control word " and " key " have been used here for...

...5 shows a first embodiment of the invention including a digital recording device and a smart card containing a second algorithm used to encrypt the code word to be registered on a digital video cassette ;

Figure 6 shows a second embodiment of the invention in which the smart card contains both the first and second keys necessary for viewing the transmitted and recorded program...

...the end user to access digital television broadcasts from one or more broadcast suppliers. A smartcard , capable of decrypting messages relating to commercial offers (that is, on or several television programmes...

...broadcast supplier), can be inserted into the receiver/decoder 2020. Using the decoder 2020 and smartcard , the end user may purchase events in either a subscription mode or a pay-per...

...and so on.

First encrypting units in the form of ciphering units 3008 utilising "mother" smartcards 3010 are connected to the SAS by linkage 3012. Second encrypting units again in the form of ciphering units 3014 utilising mother smartcards 3016 are connected to the mutliplexer 2004 by linkage 3018. The receiver/decoder 2020 receives a "daughter" smartcard 3020. It is connected directly to the SAS 3002 by Communications Servers 3022 via the modemmed back channel 4002. The SAS sends amongst other things subscription rights to the daughter smartcard on request.

The smartcards contain the secrets of one or more commercial operators. The " mother " smartcard encrypts different kinds of messages and the "daughter" smartcards decrypt the messages, if they have the rights to do so.

The first and second...

...VME card with software stored on an EEPROM, up to 20 electronic cards and one smartcard 3010 and 3016 respectively, for each electronic card,

one (card 3016) for encrypting the ECMs...

...the corresponding ECM from the MPEG-2 stream and passes the ECM to the "daughter" smartcard 3020 of the end user. This slots into a housing in the receiver/decoder 2020. The daughter smartcard 3020 controls whether the end user has the right to decrypt the ECM and to...

...particular operator to provide certain free services. An "audience" is the totality of subscribers having smartcards which bear the same Operator Identifier (OPI). Finally, a "unique" EMM is addressed to the unique identifier of the smartcard.

Encryption Levels of the System

Referring now to Figure 3, the encryption levels in the...

...Cex.

The decryption units DChp and DChl and the associated keys are held on a smart card provided to the subscriber and inserted in a smart card reader in the decoder. The keys may be generated according to any known symmetric key algorithm, such...

...5, the present invention provides a means for overcoming this problem.

The system comprises a smart card 4004, insertable in a smart card slot in the receiver/decoder, together with a digital recorder 4005, eg a DVHS recorder...

...a DVHS cassette.

In this embodiment, the received control word is decrypted by the associated smart card 3020 inserted in the decoder (see Figure 2). The decoded control word Ce (together with any other data that forms the ECM, such as access control information etc) is then passed to the microprocessor embedded in the smart card 4004. Using a second encryption key C2 and second encryption algorithm Ch2, the smart card 4004 generates a new ECM, indicated as ECM' in the figure. This entitlement message ECM...

...decoder to descramble the program for viewing.

In the system shown in Figure 5 the smart card 4004 is different from the smart card 3020 shown in Figure 2 of the television system and which contains the encryption keys...

...for viewing of the program. However, in the alternative embodiment shown in Figure 6, the smart card 3020 contains both the first and second encryption keys Cex and C2 needed for viewing...

...obtain that month's key Cex stored in the memory of the card. Although the smart card has been shown in the form of a substantially rectangular card, other physical forms, such...

...digital recording device may be combined or interchanged, such that the digital recorder possesses a smart card slot for receiving a smart card, for example, and/or the necessary elements to descramble the program once the control word...

...CLAIMS key (Cex) necessary to decrypt the information, characterized in that the decrypted information is thereafter re-encrypted using a second key (C2) stored in a smart card (3020; 4004) adapted to be received in a smart card reader in the decoder (2020), the re

- **encrypted** information being thereafter recorded on a digital recording medium (4006) by a digital recorder (4005), and in which the **smart card** also contains a number of credit units (U) to **determine** how many times a recording may be replayed, the number of units being decremented with...

...any of claims 1 to 3, wherein the second key (C2) is stored on a **smart card** associated with the recording medium.

6. A combination of a decoder (2020) for receiving digital...

...to an equivalent of the first key (Cex) necessary to decrypt the information, and a **smart card** (3020; 4004) adapted to be received in a **smart card reader** in the decoder (2020), characterised in that the **smart card** (3020; 4004) possesses a second key (C2) for use in **re - encrypting** the decrypted information for subsequent transmittal to a digital recording device (4005) for recordal on a digital recording medium (4006) and in which the **smart card** also contains a number of credit units (U) to **determine** how many times a recording may be replayed, the **smart card** being arranged to decrement the number of units with each subsequent partial or complete playing...

...particular segment of the recording such that, upon playing a section of the recording, the **smart card** is arranged to decrement certain credits associated with that section.

8. A combination as claimed in claim 7 in which the credit units are of a single type and the **smart card** is arranged to decrement the credit units with the playing of any section of the recording.

9. A **smart card** (3020; 4004) adapted to be received in a **smart card reader** in a decoder (2020), the **smart card** receiving from the decoder digital information (Ce) encrypted using a first key (Cex) and having...

...to an equivalent first key (Cex) necessary to decrypt the information, characterized in that the **smart card** (3020; 4004) possesses a second key (C2) for use in **re - encrypting** the decrypted information for subsequent transmittal to a digital recording device (4005) for recordal on a digital recording medium (4006) and in which the **smart card** also contains a number of credit units (U) to **determine** how many times a recording may be replayed, the **smart card** being arranged to decrement the number of units with each subsequent partial or complete playing...

...report, while useful, by no means spells serious difficulty for the
technology.

According to Bellcore, smart cards can be manipulated into making a
computational error that would render them vulnerable to de-encryption by
criminals.
